

Optum Insight CEO Dashboard — Business Questions & Dataset Guide

2026-09-22 · @Someone

Purpose and context

The Optum Insight CEO asked Ideas2IT for a visualization tool showing where the business is winning, losing and can find savings. This doc lists the five CEO-level business questions the dashboard answers, then describes the dataset used to build it:

`Optum_Insight_CEO_Dashboard_Dataset.xlsx`.

Optum Insight is the data, analytics and technology segment of UnitedHealth Group's Optum. It reported FY2025 revenue of \$19.4B (up 4%) and earnings from operations of \$2.6B (down from \$3.1B), with margins squeezed by new-product and growth investment ([FY2025 release](#)). In Q2 2026 it reported revenue of \$5.4B and earnings from operations of \$1.4B ([Q2 2026 release](#)).

Every KPI below follows the project's source of truth: business question, then KPI, grain, tool and visual, with each KPI having a definition, source, aggregation rule and validation method.

The five CEO business questions

Four questions go to Power BI as a governed, recurring CEO dashboard; the product-portfolio question goes to Excel as an annual review.

#	Business question	Headline KPI	Grain	Tool	Chart
Q1	Are we growing, and which business lines are winning or losing?	Revenue and YoY growth %	Business line × quarter	Power BI	Bar chart sorted by YoY growth %, with revenue KPI cards
Q2	Where are we winning and losing clients?	Net revenue retention (NRR) %, new-logo win rate, churned ACV	Segment × state × quarter	Power BI (trade-off vs Tableau)	Filled map for context plus sorted bar chart

#	Business question	Headline KPI	Grain	Tool	Chart
Q3	Which products should we invest in, fix or exit?	Revenue growth % vs operating margin %	Product × fiscal year	Excel (trade-off vs Power BI)	Bubble chart with quadrant lines
Q4	Where can we save on our own cost base?	Adjusted operating margin % and cost-to-serve per client vs target	Business line × month	Power BI	Line chart over 24+ months with target line
Q5	Are our AI and automation products delivering savings?	Automation rate % and client savings delivered (\$)	AI product × month	Power BI (OLTP vs OLAP example)	Gauge vs target plus sorted bar chart of savings by product

KPI definitions

1. **Revenue YoY growth %** = (revenue this quarter – revenue same quarter last year) ÷ revenue same quarter last year. Compare 2026 against the recast 2025 figures.
2. **NRR %** = FY2025 revenue from clients active in Jan 2024 ÷ their FY2024 revenue.
New-logo win rate = new logos won ÷ (won + lost).
3. **Operating margin %** = (revenue – recurring cost) ÷ revenue, per product; one-time items excluded.
4. **Adjusted operating margin %** = (revenue – cost excluding one-time items) ÷ revenue.
Cost-to-serve = recurring cost ÷ distinct active clients.
5. **Automation rate %** = automated transactions ÷ total transactions. **Client savings** = denials prevented × average claim value + payment-integrity recoveries + hours avoided × blended labor rate.

Q5 is the OLTP vs OLAP example: in a real build, claims, coding and prior-authorization engines are OLTP systems, so transactions are aggregated nightly into a star-schema fact table rather than queried live.

Dataset overview

The dataset is one Excel workbook covering Jan 2024 – Jun 2026 (30 months, 10 quarters): real Optum Insight segment results plus synthetic detail scaled to match them exactly.

Attribute	Value
File	Optum_Insight_CEO_Dashboard_Dataset.xlsx
Time window	Jan 2024 – Jun 2026 (monthly facts)
Sheets	15: 2 real, 10 synthetic data, 1 calculated, README, Assumptions
Row counts	Fact_Revenue 20,379 · Fact_Cost 1,495 · Fact_AI_Transactions 4,565 · Fact_Opportunities 959 · Dim_Client 425
Units	Facts in \$ thousands; real sheets in \$ millions
Real data	Optum Insight revenue, earnings from operations, one-time items, contract backlog, 2026 guidance
Synthetic data	Clients, products, business lines, states, costs, AI transactions, sales opportunities
Tab colours	Green = real · Orange = synthetic · Blue = calculated · Grey = documentation

Reporting basis matters. On 1 Jan 2026 Optum Financial moved from Optum Health into Optum Insight and prior periods were recast. Facts for 2024–2025 reconcile to results as originally reported; facts for 2026 reconcile to the recast basis. Business line BL5 (Health Financial Services) therefore appears only from Jan 2026.

Synthetic client IDs, product categories and "Competitor A–F" are invented. They are not Optum's actual clients, products or competitors.

Data dictionary

Every table includes a `Data_Type` column labelling each row real, synthetic or reference.

Real tables

Sheet	Grain	Key columns	Data_Type
Real_Quarterly	One row per quarter; section 1 original basis (2024-Q1 to 2025-Q4), section 2 recast basis (2025-Q1, 2025-Q2, 2026-Q1, 2026-Q2)	Quarter_Key, Revenue, Earnings from Ops, Operating Margin, Revenue YoY %, One-time Items, Adjusted Earnings from Ops, Adjusted Op Margin, Contract Backlog, Note, Source (USD millions; backlog in USD billions)	Real; Real – estimated split for 2024 Q1-Q3 one-time costs
Real_Annual	One row per metric	Metric, FY2024, FY2025, YoY, Source; plus 2026 guidance: revenue above 21,000, reported EFO above 4,925, adjusted EFO above 4,750 (USD millions), about 22.6% adjusted margin	Real, Real – calculated, Real – guidance

Dimension tables

Sheet	Rows	Key	Columns
Dim_Date	30	Date	Year, Quarter, Quarter_Key, Month_Num, Month_Name, Reporting_Basis
Dim_BusinessLine	6	Business_Line_ID	Business_Line, Description (BL0 Corporate/Unallocated, BL1 Provider Solutions, BL2 Payer Solutions, BL3 Life Sciences, BL4 Government & Advisory, BL5 Health Financial Services)
Dim_Product	15	Product_ID	Product, Business_Line_ID, AI_Enabled (P02, P05, P06 are AI)

Sheet	Rows	Key	Columns
Dim_Client	425	Client_ID	Segment, State_Code, Region, Size_Tier, Acquisition_Type, First_Active_Month, Churn_Month, Active_Jan2024, Revenue_2024_USD_K, Revenue_2025_USD_K
Dim_State	51	State_Code	State, Region (Northeast, Midwest, South, West)

Fact tables

Sheet	Grain	Measures	Keys
Fact_Revenue	Client × product × month	Revenue_USD_K	Date, Client_ID, Product_ID, Business_Line_ID
Fact_Cost	Product × cost category × month; one-time items on product P00	Cost_USD_K, Is_One_Time	Date, Product_ID, Business_Line_ID, Cost_Category
Fact_AI_Transactions	Client × AI product × month	Transactions, Automated_Transactions, Denials_Prevented, Avg_Claim_Value_USD, Recoveries_USD, Hours_Avoided, Client_Savings_USD (formula)	Date, Client_ID, Product_ID
Fact_Opportunities	One row per CRM opportunity	ACV_USD_K, Outcome (Won/Lost), Opp_Type (New Logo, Expansion, Renewal), Competitor, Loss_Reason	Opp_ID, Close_Date, Client_ID, State_Code, Product_ID

Supporting sheets

Sheet	Contents
Targets	KPI targets: real guidance where available (adjusted margin 22.6%), synthetic otherwise (NRR 100%, automation 65%, revenue growth 5%, cost-to-serve down 5%)
Assumptions	Labor rate of 55 USD per hour (editable; savings recalculate), AI product parameters, churn and win rates by region
KPI_Preview	Formula-driven validation and a preview of all five KPIs
README	Legend, reporting-basis notes, caveats

Year, Quarter_Key and Business_Line_ID repeat on the facts for Excel formulas; in Power BI, drop them and use the Date and Product dimensions.

Question-to-data mapping

Each question draws on one or two fact tables, sliced by the shared dimensions.

Question	Fact tables	Dimensions	KPI_Preview section
Q1 Growth by business line	Fact_Revenue	Dim_Date, Dim_Product, Dim_BusinessLine	B
Q2 Clients won and lost	Fact_Revenue, Fact_Opportunities	Dim_Client, Dim_State, Dim_Date	C, D
Q3 Product portfolio	Fact_Revenue, Fact_Cost	Dim_Product, Dim_Date	E
Q4 Cost base and margin	Fact_Revenue, Fact_Cost	Dim_BusinessLine, Dim_Date, Dim_Client (client counts), Targets	F

Question	Fact tables	Dimensions	KPI_Preview section
Q5 AI savings	Fact_AI_Transactions	Dim_Product, Dim_Client, Dim_Date, Assumptions, Targets	G

```
flowchart LR
    D[Dim_Date] --> R[Fact_Revenue]
    D --> C[Fact_Cost]
    D --> T[Fact_AI_Transactions]
    D --> O[Fact_Opportunities]
    P[Dim_Product] --> R
    P --> C
    P --> T
    P --> O
    B[Dim_BusinessLine] --> P
    CL[Dim_Client] --> R
    CL --> T
    CL --> O
    S[Dim_State] --> CL
    S --> O
```

Relationships are one-to-many from each dimension to the facts, single-direction filtering; Dim_BusinessLine reaches the facts through Dim_Product (a snowflake step you can flatten in Power Query).

Validation and caveats

All 10 quarters reconcile exactly: synthetic revenue and revenue-minus-cost match real reported Optum Insight revenue and earnings from operations (KPI_Preview section A shows "Reconciled" for each).

Data_Type label	Meaning
Real	Taken directly from UnitedHealth Group filings
Real – estimated split	Real total, estimated breakdown across quarters
Real – calculated	Formula on real inputs

Data_Type label	Meaning
Real – guidance	Company's own 2026 outlook
Real – 2026 realignment	Real segment change; values synthetic
Synthetic	Invented training data
Reference	Calendar and US state lookups

Caveats:

- The 876 USD million of 2024 Q1–Q3 cyberattack costs is real in total, but its quarterly split is estimated.
- Contract backlog for 2024 Q1 and for 2026 was not in the releases used, so it is blank.
- Opportunity ACV (bookings) does not reconcile to revenue by design.
- Alegeus, acquired 2 Jul 2026, falls after the data window.
